for Haven Landscaping & Real Estate

Digital Consulting & Problem-Solving

An exclusive proposal for Angel Quintero

ZNAS LLC | April 2026 | Confidential

.01 · Why This Conversation

Every business that has been around for 20 years carries a body of knowledge, a way of working, and a set of habits that got it where it is. The next stage of growth rarely depends on doing more of the same; it usually depends on what gets built around the work that is already happening.

This proposal lays out how ZNAS would help Haven build that next layer. The starting point is the suspended Google Business Profiles, the most urgent issue on the table today. From there, the work continues across whatever digital and technological problems are holding the business back.

.02 · How ZNAS Comes In

ZNAS comes in as a consultant and a fixer. The role is straightforward: identify the digital and technological problems that are holding Haven back, and solve them one by one, in the order that makes the most impact for the business.

This engagement operates as a freelance consulting relationship. José Sanz steps in as Haven's fractional CTO, supported by his team where needed. He does not replace anyone on the Haven side; he works alongside Angel, brings outside expertise, and takes ownership of the technical problems Haven needs resolved.

The starting point is already on the table: the suspended Google Business Profiles. That is the first problem ZNAS attends to, in parallel with a broader assessment of Haven's digital operation. From there, the work continues, covering whichever priorities surface as the most valuable to address next.

Throughout the engagement, ZNAS proposes, substantiates, and recommends; Haven gives the green light on every step. Each phase of work is presented for review and approval before being executed. Angel keeps full control over the direction, the pace, and the depth of what gets done.

.03 · How the Work Is Structured

Although the full scope of the project is defined as the work progresses, every ZNAS engagement follows the same three-phase logic. This structure gives the project a clear backbone and allows Haven to know, at any moment, which stage of the process it is in and what comes next.

Phase 1: Assessment

The first phase is dedicated to understanding Haven in depth, from a technological and operational perspective. José Sanz analyzes how the business runs today, which tools and systems are in use, where the current technology is falling short, and which manual processes can be replaced or improved through automation and artificial intelligence. On that basis, he evaluates which technologies and platforms best fit Haven's reality and goals.

This work is not done based on assumptions; it is done based on direct observation of the operation, conversations with Angel and his team, and review of the available data.

From the first week, ZNAS also takes on the technical issue of the suspended Google Business Profiles, Haven's primary lead-generation channel, to begin recovering visibility on Google as quickly as possible, while the broader assessment runs in parallel.

> **Result:** Haven has a clear picture of where the business stands today in terms of its digital maturity, and a map of the real opportunities to transform through technology and AI.

Phase 2: Transformation Proposal

With the assessment in hand, José Sanz returns with a concrete proposal. It is not a generic digitalization plan or an open-ended recommendation; it is a tailored technological restructuring roadmap for Haven, detailing which systems will be built or replaced, which processes will be automated, in what order, how long each component takes, and what results to expect at each stage.

Angel reviews the proposal, asks the questions he needs to ask, adjusts what needs to be adjusted, and approves. ZNAS proposes, substantiates, and recommends; Haven gives the green light to move forward.

> **Result:** Haven holds a specific, approved roadmap with full visibility into what will be built, in what order, and what to expect.

Phase 3: Execution

Once the plan is approved, execution begins. José Sanz and his team implement each technological piece in the agreed order, integrating the new systems with the existing operation, training Haven's team in the use and administration of the new tools, and adjusting the plan as the business responds. The duration of this phase depends on the scope of the approved plan and the pace Haven decides to sustain.

At some point, the new digital infrastructure is operating at full capacity, Haven's team is autonomous in its day-to-day, and the engagement either closes or transitions into a lighter strategic advisory relationship.

> **Result:** Haven operates with its new digital infrastructure at full capacity, the team works autonomously, and the transformation is complete.

At any point in the process, Angel keeps full control over how and at what pace the work moves forward. If at any moment he prefers to pause, resume later, or execute part of the plan with his own resources, all are valid options within the engagement.

.04 · How ZNAS Works

What sets ZNAS apart is not only José Sanz's experience. It is the methodology with which he and his team operate: each member works as an AI orchestrator, integrating the most advanced models on the market into every stage of the process: design, development, testing, and deployment. That methodology is what allows a project that would traditionally take years to be compressed into months without sacrificing quality.

Throughout the engagement, José Sanz leads the strategy and architecture, while his team supports the execution where needed. Haven gets a senior consultant focused on solving the right problems, backed by a team that can move fast and deliver.

.05 · Who Leads

José Sanz

17+ years in technology | Founder, ZNAS LLC | Co-founder, Visionarys

Software architect with a track record in real-scale systems: Afni, Amadeus IT Group (global airlines), CyraCom International (12 years, platform processing millions of minutes). Founder of ZNAS LLC and co-founder of Visionarys. Creator of CoPresent and MemQL. MIT Certification in AI Business Strategy. Native bilingual in English and Spanish.

José Sanz does not advise on artificial intelligence. He builds it and deploys it in real production. He and his team operate as AI orchestrators: each member amplifies their experience with the most advanced AI models on the market, multiplying delivery capacity, quality, and speed.

What Haven gets from José Sanz:

- Executive technology leadership: José Sanz proposes, substantiates, and executes. Angel authorizes and gives the green light on every implementation decision
- Direct execution: writes code, deploys systems, delivers working results
- Regular progress reports
- Training and knowledge transfer to the Haven team
- Clear continuity plan at the end of the engagement

.06 · ZNAS and CoPresent: A Note on Scope

During the first conversation with José Sanz, CoPresent was mentioned as part of the broader vision for Haven. This section formalizes that conversation and clarifies the boundary between two different things, so Haven has full visibility going in.

What This Proposal Covers

This proposal covers the work of ZNAS: the consulting, the assessment, the strategic recommendations, the architecture, and the technical execution carried out by José Sanz and his team. ZNAS is the consulting service that Haven contracts through this engagement.

About CoPresent

CoPresent is a separate AI-powered operational platform developed by Visionarys, a company where José Sanz is also a co-founder. It is the platform that would eventually host the intelligent agents Haven has expressed interest in, the kind that would take over recurring operational tasks once the foundational digital work is in place.

CoPresent is currently undergoing a restructuring process and is not yet open to the public. When the platform becomes available, Visionarys will reach out to Haven directly to extend an invitation to evaluate it and discuss whether it fits Haven's operation. That conversation is independent of this proposal and would happen under a separate agreement directly between Haven and Visionarys.

If, after Phase 1, José Sanz recommends CoPresent as the right operational platform for Haven and Angel decides to move forward with it once the platform becomes available, ZNAS can lead the setup process, configuring the platform to fit Haven's specific needs, integrating it with the rest of the operation, and walking through every step alongside Angel. The setup work would be part of the ZNAS engagement, while the platform subscription itself remains a separate agreement with Visionarys.

For the purposes of this engagement, the focus is on ZNAS: solving the digital problems in front of Haven today and laying the groundwork for the transformation ahead.

The Real Estate Agent

During the initial conversation, one of the most concrete opportunities that came up was around Haven's real estate operation. Angel identified that the most time-consuming part of that work is the property research and bidding process: finding the right properties, evaluating them, and making decisions. ZNAS and Visionarys are currently actively building an agent to address exactly this.

The agent starts with Zillow integration, giving it direct access to property listings, pricing data, and market comparables. From there, it will be trained on the specific knowledge and context Angel provided: how he evaluates properties, what criteria matter, how he makes decisions. The goal is not a generic search tool. It will work the way Angel works, at a fraction of the time.

This agent runs on CoPresent. When the platform becomes available, the setup and configuration of this agent would be handled as part of the ZNAS engagement. The platform subscription itself remains a separate agreement with Visionarys.

.07 · Engagement Terms

Renewal
Month to month, by mutual agreement. No long-term commitments. If at any point either party decides to conclude the engagement, 15 days' notice is required.

Out of Scope
Work outside the agreed scope is billed separately, with terms defined in advance.

Non-Exclusivity
José Sanz and ZNAS may take on other projects in parallel. This is the standard model for a fractional CTO engagement.

About CoPresent
As detailed in section .06, José Sanz is a co-founder of Visionarys, the company that develops CoPresent. This relationship is disclosed up front. CoPresent is not part of this engagement; if Haven chooses to evaluate it once the platform becomes available, that would be formalized in a separate agreement directly between Haven and Visionarys.

Insurance
ZNAS LLC holds active Tech E&O, Cyber Liability, and AI coverage of $1M USD. Certificate available upon request.

Confidentiality
All shared information is confidential. NDA available if Haven requires one.

Intellectual Property
Everything ZNAS builds specifically for Haven: configurations, agents, architectures, dashboards, and documentation belongs 100% to Haven. ZNAS retains no rights over these elements.

.08 · Next Steps

01 Angel reviews this proposal and shares any questions

02 A meeting is scheduled to walk through open points and align

03 The agreement is formalized

04 Work begins. First weeks: assessment of the business in parallel with recovery of the suspended Google Business Profiles

Prepared exclusively for Haven Landscaping & Real Estate LLC by ZNAS LLC. Confidential.
