Engagement Proposal

Fylo × ZNAS

Prepared for Carlos Valenzuela

Revised · July 9, 2026

Prepared by ZNAS LLC for Fylo

ZNAS LLC | ARIZONA, USA | CONFIDENTIAL

This proposal is valid for 30 days from the date of issue

1. Executive Summary

At ZNAS, we build custom, AI-powered systems that solve real operational problems, and then we stay to help the business grow around them. This proposal outlines a long-term partnership with Fylo, centered on the **Fylo Warehouse OS** — a custom operations platform that unifies your entire fulfillment operation into a single system. The mockup you've already previewed and validated isn't an abstract concept; it's a detailed reflection of the operation you described to us, designed to match the vision you already had in mind — and this engagement is about building it into a fully functional system.

Beyond the platform, this proposal covers two areas of work. On the **technical side**, we handle the platform's development, its integrations with your sales channels, and ongoing technical consulting and development led by José Sanz as your forward deployed AI engineer. On the **marketing side**, we bring your brand to life, alongside a menu of marketing services designed for a product launch, which you can adopt as they fit your needs.

Our approach is simple: we solve problems and build for the long term, giving Fylo an operational backbone that matches the ambition of the brand. And beyond it, in any other area where you need us, we're a team that leverages AI to build and solve problems, whatever they turn out to be. What follows is the full scope of what we're proposing, how each piece creates value for Fylo, and the terms under which we'd work together.

2. The Engagement

This engagement covers two areas: technical services and marketing services. They can be adopted together or independently — the platform stands on its own, and marketing is yours to add when you're ready.

Area A — Technical Services

2.1 Product Development — Fylo Warehouse OS

The core of this engagement: a single platform that runs your entire fulfillment operation, built specifically for how Fylo works. Instead of four separate tools with scattered information, everything lives in one system. What each person sees depends on their role, all drawing from the same live operation.

Manager View — your cockpit.

Your full view of the business, on your phone: orders, revenue, average order value, orders per hour, inventory, revenue by channel, team leaderboard, and a bonus calculator. It also includes a built-in AI assistant you can talk to: instead of scrolling to find what you need, you ask a question in your own words and it pulls the answer straight from your live operation.

Value: full visibility over the operation from your pocket, without digging for data.

Station Monitor — the floor at a glance.

A 43–55" floor display showing the day's goal, the leaderboard, celebrations, and the live status of every order moving through picking → assembly → packing → shipping.

Value: shared visibility that keeps the floor moving, with no need to ask for status updates.

Worker Tablet — guided and accountable.

Walks each worker step by step: scan, count, confirm with a photo, using the barcodes already on your packaging. Every scan is logged to the person who made it, and once a step's items are all scanned, the order advances to the next table. Since each table handles a distinct step, we recommend one tablet per table for full traceability; a lighter one-tablet-per-station setup is also available — a matter of configuration, not rebuilding.

Value: near-zero training time, full traceability of who did what, and a workflow that matches how your floor already works.

Customer Support Dashboard — one desk for every customer.

Brings every conversation into one place, with each customer's full profile and order status, plus AI-suggested replies. Includes a Clinical Knowledge Assistant that drafts answers to health questions — always behind a mandatory human approval gate before anything medical is sent. Handles returns end to end: refund, replacement, or store credit, label, and receipt, all in one screen.

Value: a professional support experience that protects your clinical credibility and scales as you grow.

When the AI goes live.

The v1 build delivers these AI capabilities running on a real backend and live language models — not the scripted demonstrations shown in the mockup. We stage them in sensible order during the build (the manager assistant and support replies first, the clinical assistant once its knowledge base is populated and approved with you), and confirm the sequence together at kickoff.

2.2 Technical Integrations

The platform is built to bring all of your sales channels into one system. Our approach is API-first: we connect to each channel through its official, secure integration, the most reliable and maintainable way to keep your orders, inventory, and tracking in sync automatically. Here's where each of your confirmed channels stands:

- **Shopify** — fully integrable and the backbone of the system. We connect to orders, inventory, and tracking in both directions, so the platform can ingest orders and mark them shipped automatically.
- **Amazon (Seller Central)** — integrable. Customer information and buyer messaging follow Amazon's own secure pathways; how deeply we can automate fulfillment and replies depends on whether you use Amazon's fulfillment (FBA), your own (FBM), or both. We confirm the exact depth in the working session.
- **In-office retail (Farmville dental office)** — integrable through your point-of-sale system. If it's Shopify POS, in-office sales flow into the same stream automatically and most manual reconciliation disappears.
- **Wholesale (dental offices)** — integrable, with the approach shaped by how you manage wholesale orders today: a portal, purchase orders, a spreadsheet, or your own system.
- **Your internal office system** — we connect directly to systems you own and control, depending on which system it is and getting connection access from you.
- **Other retail partners** — the platform's channel layer is built to add new partners as they come, without rebuilding the core.

Optional additional channels. Channels beyond those above — for example TikTok Shop — are not part of the confirmed v1 scope, but the platform is designed to add them cleanly through their official APIs. If you'd like any included, we'll scope and price them as a defined add-on rather than assume them here.

For the rare case of a system with no official integration available, ZNAS can build an AI agent that operates the system's interface like a human would. Where an official API exists, we always use it first; the agent is a powerful fallback for the exceptions. To finalize the integration plan, we'll hold a focused working session to confirm the current state of each channel, so the plan is grounded in exactly how Fylo operates today.

2.3 Technical Consulting & Development

Building the platform is only part of the value. Throughout the engagement, José Sanz works directly with you as your forward-deployed AI engineer — the technical lead who architects the system, guides development, and stays close to your operation so what we build actually fits how Fylo works. As your business evolves, he's the person translating new needs into technical decisions, whether that's refining the platform, adding capabilities, or advising on where AI can create leverage.

The platform is built on MemQL, an open-source backend developed by José Sanz. Because MemQL is open source, Fylo isn't locked into proprietary infrastructure that only one vendor can maintain — a deliberate choice that keeps the system durable and transparent as it grows.

Value: a dedicated technical partner who understands your operation firsthand, and a platform built on open, future-proof foundations.

Area B — Marketing Services

Marketing is where we help bring the Fylo brand to life. This proposal formally scopes the creation of your Fylo Hero brand assets, and presents a clear, tiered menu of ongoing marketing support you can adopt as you grow — you choose what, if anything, to

add, and when.

3.1 Brand Assets — Fylo Hero

Fylo Hero is your brand's most strategic content asset — the character does for Fylo what Duo does for Duolingo: the face of the brand, the hook for the child, and the vehicle for education. Building on the character model sheet we already showed you, we produce:

- **Character storytelling and voice** — developing the full personality of the character.
- **Animated Fylo Hero reels** — 15–20 second videos, starting with brushing and flossing, built from scripts you provide or that we develop with you. Beyond social media, these can run on the waiting-room screens at your dental office.
- **A reusable clip library** — a bank of Fylo Hero animations you can use across your website, social, email, and in-office point of sale.

Value: a distinctive, ownable brand character that drives engagement with kids and builds recognition across every channel.

3.2 Marketing Service Tiers

Because your Fylo Hero character is already designed, we produce content efficiently and we pass that efficiency on to you. Marketing runs as a month-to-month retainer, separate from the platform build, in three tiers. Each is deliverable-based, and you can move up or down as your needs change. Advertising spend, if you choose to run ads, is separate and billed at cost — never marked up inside the retainer.

Tier	What's included	Monthly ceiling (2026)
Tier 1 — Brand Content	Fylo Hero production: animated reels plus the growing clip library. The launch essential.	up to \$2,500
Tier 2 — Growth	Everything in Tier 1, plus organic SEO (Fylo DTC + Farmville local), social media management, and email / retention flows.	up to \$5,000
Tier 3 — Full Partner	Everything in Tier 2, plus marketing strategy and coordinated execution across both the Fylo and Farmville brands.	up to \$8,000

Each figure is a **monthly ceiling, not a fixed fee** — what you actually pay in a given month depends on the volume of work you need and the results delivered for Fylo. In a lighter month, you pay less.

These ceilings sit at or below what the 2026 market charges for comparable work — and you get more for them. Here's the honest comparison:

- **Traditional full-service agencies** bundling SEO, email, paid social, and content typically run \$3,000–\$8,000/month for small-to-mid businesses, with most full-service engagements starting around \$4,000/month. Our Tier 2 delivers that same multi-channel scope with a \$5,000 ceiling — and you only pay it in the months the work justifies it.
- **The way we work is structurally leaner.** ZNAS operates on systems and AI-assisted production, not on billing you for headcount and hours. Industry data for 2026 puts AI-native agencies at 20–40% below traditional agencies retainer-to-retainer, while producing several times the output per dollar. That structural advantage is why we can set these ceilings where we do without cutting quality.
- **Your character asset is already built.** The most expensive, fixed part of branded animation — designing and rigging the character — is done. Most agencies would charge that as a separate setup fee (\$3,000–\$6,000) before producing a single reel. You skip it entirely; every dollar goes to content, not to re-building the foundation.
- **No hidden add-ons.** Revisions, reporting, and strategy calls are inside the retainer. The only things billed separately are third-party costs (ad spend, premium tools), always passed through at cost — never marked up.

A detailed list of everything available at each tier — brand identity, website and CRO, Amazon/Shopify optimization, wholesale sales kit, and local marketing for Farmville — is available on request.

4. Timeline — Fylo Warehouse OS Build

Based on the scope we've defined together — the four views, the channel integrations, the AI layer, and the features you've already seen in the validated mockup — a full build of the Fylo Warehouse OS runs approximately **6 to 8 months**.

This is a working estimate, not a rigid deadline. A short paid working session at kickoff confirms the handful of open v1 decisions — how bonuses are attributed (per station or per person), the worker login method, low-stock thresholds, and the target operating scale. The price and timeline in this proposal assume the v1 scope described here; if those decisions or your feedback expand the scope materially, we'll align on the adjusted price and timeline together before proceeding. The platform is built to grow, so new capabilities can be added in phases as Fylo evolves.

The complementary services run on their own rhythm. Marketing, ongoing technical consulting, and general problem-solving aren't tied to the build timeline — they run for as long as you find them valuable, and you can scale them up or down as your needs change.

5. Engagement Terms & Pricing

At ZNAS we charge for value, results, and problem-solving — not for hours. The pricing below is framed around the asset you'll own and the value the Fylo Warehouse OS brings to your operation, based on the v1 scope and features we've defined together so far. As with the timeline, this value can change if you decide to grow the platform — adding new features, deeper integrations, or capabilities beyond the current scope — and we'd align on any adjustment together before proceeding. A detailed breakdown by service area is available on request.

The value. As detailed in the accompanying Value Assessment, the Fylo Warehouse OS application is valued at **\$225,000**. This is the asset you own — proprietary software on your balance sheet, not a subscription you rent. How you pay for it is flexible; the three options below fit different ways of growing.

Option A — Full Purchase

You purchase the platform outright and own 100% of the app from day one. Paid in three stages rather than a single lump sum:

- 40% to start — \$90,000
- 30% at the midpoint — \$67,500
- 30% on delivery — \$67,500

Includes one year of maintenance (defined in 8.7). If you prefer to pay the full amount upfront, we offer a prepayment courtesy of 10% (\$202,500).

The cleanest path: you own everything, no strings.

Option B — Monthly Retainer with Credit Toward Ownership

If you'd rather spread the cost and grow into ownership, you pay a monthly retainer that funds active work and steadily builds your ownership of the platform:

- To begin, an initial commitment down payment of 15% (\$33,750) confirms the engagement and reserves our team. Like the monthly payments, 50% of it (\$16,875) credits toward ownership.
- Monthly retainer of \$12,000 during active development.
- 50% of each payment (\$6,000/month) credits toward the \$225,000 valuation — you are steadily buying the asset.
- The other 50% funds that month's active development, new capabilities, and support — real work delivered, not a second charge for the same asset.
- You can complete ownership at any time by paying the remaining balance to the agreed valuation. Your cumulative payments that count toward ownership never exceed \$225,000 — you never pay twice for the same asset.
- Example: with the down payment plus a 6–8 month build, you'll have credited roughly \$53,000–\$65,000 (24–29%) toward ownership, with the option to buy out the balance at the agreed value whenever you're ready.

Hosting, AI operation, and any out-of-scope work are billed separately (see Section 7). As the platform grows with major new capabilities, its value can be revisited together — so ownership always reflects what's actually been built.

Best if you want to spread cost and grow into full ownership over time.

Option C — License / Revenue Share

The lowest upfront commitment: ZNAS keeps ownership of the app and you pay as the platform earns for you — ideal if you'd rather invest your cash in launching the brand right now.

To begin, an initial commitment down payment of 15% (\$33,750) confirms the engagement and reserves our team before development starts. From there, you pay as the platform earns for you, in one of two simple ways:

- A small fee per order the platform processes, or
- A percentage of the revenue flowing through the system,

for a defined term. We'd set the exact figure together once we look at Fylo's order volume, so it's fair on both sides. Under this model, ZNAS retains ownership of the app until the full \$225,000 platform value has been paid, at which point the app becomes yours outright.

Best if cash is better spent on launch today and you expect Fylo to scale.

Flexible by design. These aren't rigid boxes. If a hybrid fits Fylo better — a partial upfront payment plus credit toward the rest, for example — we'll build it with you. Whatever the structure, the value of the platform stays the same; what we flex is how it fits your cash flow.

6. The Value of What You're Getting

You've just seen the price. Here's why it's an investment, not an expense, and why \$225,000 is a number we can both stand behind.

This is an asset you could own, not a tool you can only rent. Most brands run their operation on a stack of five separate subscriptions — inventory, order management, support, AI, analytics — that never quite talk to each other and cost around \$24,000 every year, indefinitely, with nothing to show for it at the end. The Fylo Warehouse OS is the opposite: one platform, built around how Fylo actually works, that lands on your balance sheet as intellectual property. Whichever payment path you choose, it can end up fully yours.

Priced against what it replaces, not the hours behind it. Independent 2026 benchmarks put a from-scratch build of a system like this at \$200,000–\$350,000 from another quality vendor. That's the honest yardstick for what you're getting. We build it more efficiently than that — and rather than keep the difference, we price it into what we offer you.

And part of it simply can't be bought. The team leaderboard and bonus engine, and the Clinical Knowledge Assistant, don't exist off the shelf at any price. The Clinical Assistant puts Dr. Valenzuela's own expertise into every customer interaction — a moat no generic brand can replicate, and one that makes Fylo a more valuable company than one running on tools anyone can rent.

The accompanying Value Assessment lays out the full methodology — three independent, industry-standard methods on current 2026 data, every figure traced to a cited source. We'd encourage your own advisor to review it; the goal is a number we can both stand behind.

7. What It Costs to Own and Run

Because you would own the platform, you also run it — and we want the full cost picture on the table up front. Owning software instead of renting it means the ongoing costs are yours directly and transparently, rather than buried inside a monthly subscription fee. There are two ongoing running costs (the "upkeep" of the platform) and one one-time hardware cost. None carry a ZNAS license fee — they're third-party costs we pass through at cost, estimated here so you can budget with confidence. Final figures are confirmed at the architecture phase.

7.1 Ongoing running costs (pass-through, at cost)

Running cost	What it is	Estimated / month
Cloud hosting	The servers the platform and MemQL run on. MemQL itself is open-source (no license); you pay only for the hosting it runs on.	\$150 – \$600

AI operation	The live language-model usage behind the AI features (manager assistant, suggested replies, clinical assistant, stockout alerts), billed by usage.	\$100 – \$700
Estimated total	Scales with your order and support volume; higher as Fylo grows.	\$250 – \$1,300 /mo

That's roughly \$3,000–\$15,600 per year at launch scale, billed at cost with no markup. These are the same usage-based costs any modern AI-powered platform carries; owning the software means you control and see them directly.

7.2 Hardware (one-time, purchased by Fylo)

The platform runs on standard, off-the-shelf devices that Fylo owns — not proprietary equipment. You can purchase these directly, or ZNAS can procure them at cost on your behalf. A typical three-station setup:

Device	Estimate
Worker tablets (3–4 × \$300–\$500)	\$900 – \$2,000
Station monitors, 43–55" (3 × \$400–\$700)	\$1,200 – \$2,100
Barcode scanners (3–4 × \$150–\$300)	\$600 – \$1,200
Label printers (1–2 × \$200–\$500)	\$200 – \$1,000
One-time hardware total (est.)	\$2,900 – \$6,300

Your manager view runs on your existing phone — no additional device needed.

8. Terms & Conditions

This section outlines ZNAS's position on the key terms of the engagement. These terms are a starting point for alignment; the final agreement will formalize them in a single instrument signed by both parties.

8.1 Platform Technology

The Fylo Warehouse OS is built on MemQL, an open-source memory and reasoning platform developed by José Sanz. Because MemQL is open source, Fylo is never locked into proprietary infrastructure that only a single vendor can maintain.

8.2 Intellectual Property

Who owns what depends on the pricing model you choose (Section 5), so we've kept this simple and transparent:

- **The Fylo Warehouse OS application** — the four views, the integrations, the returns and inventory logic, and the AI features built for you. Under Option A this becomes yours outright once paid. Under Option B your ownership grows as you pay, until you fully own it. Under Option C, ZNAS retains ownership during the license term, after which the app becomes yours when fully paid.
- **MemQL, the backend engine** — ZNAS's own open-source technology, powering your platform at no license cost. It stays ZNAS property, but you get the full benefit of it built into your system and are never locked in or charged a license fee.
- **Marketing and brand assets** — the Fylo Hero animations and any brand materials created for you are yours once delivered and paid. ZNAS may show them as portfolio work but will never use them commercially elsewhere.
- **Everything that's already yours** — your business data, customer and clinical information, your brand, and your existing processes remain entirely yours. ZNAS never uses or commercializes any of it beyond running your platform.

8.3 Client Cooperation

To deliver the platform and its integrations on a reasonable timeline, Fylo's active cooperation is essential, including API documentation and access credentials for the systems to be integrated (Shopify, Amazon, and any others identified), access to any Fylo-owned databases required, timely feedback and approvals, and accurate information about existing systems. Project timelines are contingent on this cooperation; delays originating on Fylo's side will shift the timeline accordingly.

8.4 Confidentiality

ZNAS proposes a mutual (bilateral) NDA that protects both parties equally. Fylo agrees to keep confidential ZNAS's technical

methods, MemQL implementation details, pricing structures, and engagement terms; ZNAS agrees to keep confidential Fylo's business data, customer and clinical information, commercial strategy, and product roadmap. ZNAS can provide the NDA language, or if Fylo has a standard vendor NDA it prefers, that document can be used instead. The NDA remains in force during the engagement and for a defined period after termination, with standard exceptions.

8.5 Clinical Content Responsibility

The platform's Clinical Knowledge Assistant drafts suggested responses for review. Every clinical or medical response passes through a mandatory human approval gate before it can be sent to a customer. Fylo (through Dr. Valenzuela or a qualified person he designates) is responsible for reviewing and approving all medical content before it reaches a customer. ZNAS provides the technology but does not practice medicine, provide medical advice, or bear responsibility for the clinical accuracy of approved content.

8.6 Data Processing, Privacy & Children's Data

Because the platform processes Fylo's customer data and connects to third-party systems, a few points are clear on both sides:

- **Children's data (COPPA).** Fylo is a children's brand, so customer data may relate to households with minors. Fylo is the data controller and owns its customer relationships and privacy notices; ZNAS will architect the platform to support Fylo's compliance with the U.S. Children's Online Privacy Protection Act (COPPA) and similar rules — including data minimization and access controls — but responsibility for the customer-facing privacy policy and any parental-consent obligations rests with Fylo. We recommend Fylo's counsel review its privacy notices before launch.
- **Legal notices to end users.** Fylo's customers are Fylo's own; Fylo owns the privacy notice and terms its customers see. ZNAS is responsible for the technical security of the data within the platform (encryption, access controls, incident response).
- **Data processing license.** Fylo grants ZNAS a limited license to access and process the data flowing through the platform, solely to operate, maintain, and improve it. ZNAS will never use Fylo's customer data to train MemQL as a general-purpose model, nor for any purpose beyond powering this platform.
- **Third-party integrations.** Fylo authorizes ZNAS to connect to the platforms it uses, and Fylo owns the relationship with those vendors. ZNAS is not liable for failures originating in third-party systems outside its control.
- **Breach notification.** In the event of any incident affecting platform data, ZNAS will notify Fylo promptly upon discovery, and Fylo (as the party with the direct customer relationship) would handle any notifications to its customers.

8.7 Acceptance, Warranty & Maintenance

- **Acceptance.** v1 is delivered against an agreed checklist of the scope in this proposal. You have a defined review window (e.g., 10 business days) to confirm each item works as described; anything that doesn't is corrected before final acceptance.
- **Warranty.** For 90 days after acceptance, ZNAS fixes any defect — where the platform doesn't behave as specified — at no charge. This covers bugs, not new features or changes of scope.
- **Included maintenance (Option A).** The first year includes maintenance: keeping the platform running, security and dependency updates, and fixes for issues that arise in normal use. It does not include new features, new integrations, or changes to agreed scope, which are handled as change orders.
- **Change orders.** New capabilities or scope changes are scoped and quoted before work begins, so there are never surprise charges. Maintenance, support, and feature work beyond the first year are billed separately, so the platform stays supported and evolving as Fylo grows.

8.8 Liability & Insurance

Limitation of liability. ZNAS's maximum liability for any claim arising from the engagement is limited to the total fees paid by Fylo to ZNAS over a defined period preceding the event giving rise to the claim, to be finalized in the signed agreement. Neither party is liable for indirect, incidental, or consequential damages. The cap does not apply in cases of gross negligence, fraud, breach of the NDA, or intellectual property violations.

Insurance. ZNAS LLC maintains active Technology Errors & Omissions and Cyber Liability insurance with \$1,000,000 USD in aggregate coverage, including an Artificial Intelligence Coverage Endorsement specific to AI software, underwritten by an AM Best A-rated carrier (Excellent). A Certificate of Insurance is available on request, and once the agreement is signed, Fylo can be named as an Additional Insured — giving Fylo direct access to ZNAS's coverage for claims arising from ZNAS's acts or omissions in delivering the platform.

8.9 Governing Law & Independent Contractor Status

- **Governing law:** State of Arizona, U.S.A.

- **Dispute resolution:** binding arbitration, with either party retaining the ability to seek urgent injunctive relief for IP or confidentiality matters.
- **Independent contractor status:** ZNAS operates as an independent contractor of Fylo — not an employee, agent, or partner — responsible for its own taxes and expenses, and free to work with other clients (subject to the NDA).

8.10 Marketing & Brand-Asset Billing

Marketing runs as a separate month-to-month retainer at the tier you choose (Section 3.2), each a monthly ceiling: Tier 1 up to \$2,500, Tier 2 up to \$5,000, or Tier 3 up to \$8,000 per month. It is independent of the platform build, can start or stop on 30 days' notice, and advertising spend is passed through at cost. What you pay in a given month depends on the volume of work and the results delivered; you're never billed above your tier's ceiling. With the core Fylo Hero character already designed, we produce efficiently on a continuous basis.

8.11 Payment Terms

Platform milestone invoices and monthly retainers are due net 15 from the invoice date. We accept ACH/bank transfer and card. Work on a given phase begins once the prior milestone is paid. Pass-through costs (hosting, AI operation, ad spend, hardware if we procure it) are billed monthly at cost with supporting detail.

9. Next Steps

We've built this proposal around what you already told us you needed, and the platform you've already seen. From here, the path forward is simple:

- Review this proposal and the accompanying Value Assessment at your own pace.
- Let's talk — about any part of the scope, the options, or anything you'd like adjusted. Nothing here is fixed; if something doesn't fit the way you work, we'll work through it with you.
- Align on terms and pricing, and formalize the engagement so we can begin building.

This proposal is valid for 30 days from the date of issue.

Above all, this is the start of a long-term partnership, not a one-time project. We're confident in the value we can create for Fylo — and if we partner up, we won't let you down.

A. Research Sources & Methodology

Every benchmark figure in this proposal traces to a current-year (2026) source. The platform valuation follows a three-lens method (replacement cost, value in use, and strategic value) detailed in the accompanying Value Assessment. Marketing and running-cost figures are drawn from the published 2026 benchmarks below. Internal arithmetic was verified programmatically.

Platform valuation & replacement cost

- Keyhole Software — 2026 custom software cost benchmarks: keyholesoftware.com/cost-custom-software-development
- Clutch — software development pricing (avg \$132,480 / ~13 months): clutch.co/developers/pricing
- ERP Software Blog — Warehouse Management System cost, 2026: erpsoftwareblog.com/2026/02/warehouse-management-system-cost
- ClearlyAcquired — SaaS & software valuation multiples, 2025–2026: clearlyacquired.com/blog/ebitda-multiples-for-saas-and-software-companies-2025-2026
- CT Acquisitions — ecommerce M&A multiples & IP valuation, 2026: ctacquisitions.com/ecommerce-mergers-and-acquisitions

Marketing service pricing (2026)

- Darkroom — Marketing Agency Cost 2026: darkroomagency.com/observatory/marketing-agency-cost-2026-pricing-by-service
- ClicksGeek — Marketing Agency Monthly Retainer Cost 2026: clicksgeek.com/marketing-agency-monthly-retainer-cost
- GoFractional — Fractional CMO Rates 2026: gofractional.com/blog/fractional-cmo-salary
- Boulder SEO Marketing — SEO Costs 2026: boulderseomarketing.com/seo-costs-guide-understand-seo-pricing-models
- SEOProfy — Local SEO Pricing 2026: seoprofy.com/blog/local-seo-pricing
- Vidico — Animation Cost Guide 2026: vidico.com/news/how-much-does-animation-cost
- D-MAK — Social Media Video Pricing 2026: dmakproductions.com/blog/social-media-video-pricing
- Sprout Social — Social Media Management Cost 2026: sproutsocial.com/insights/social-media-management-cost

Running costs (hosting + AI operation) are estimated from standard cloud-hosting and language-model API usage pricing and confirmed at the architecture phase. Hardware figures reflect current retail pricing for standard tablets, displays, scanners, and label printers.

This proposal is a good-faith commercial estimate for discussion, not a formal appraisal or legal instrument. Figures depend on confirmed v1 scope. We recommend review by your own legal and financial advisors before signing.
